

Microsoft Advertising MCP Server: Use Cases

Ask your Microsoft Advertising data anything — in plain language.

The Microsoft Advertising MCP server connects your Microsoft Advertising account to the AI assistants and tools you already use. Ask questions in everyday language and get back clear, leadership-ready answers — performance summaries, deep dives, entity lookups, and exportable outputs for Excel, Power BI, or your next deck — without building reports or exporting raw tables by hand. The scenarios below show what you can ask today, organised by the job you are trying to do.

What you can do at a glance

- **Reporting & campaign insights** — account summaries, campaign deep dives, ad group and asset group reporting, ad and keyword performance, audience insights, entity lookups, exportable outputs, and anomaly alerts.
- **Cross-platform comparison** — structure, settings, performance, keywords, asset groups, and audiences, side by side across Google and Microsoft.

Reporting & Campaign Insights

Turn your campaign data into quick daily and weekly summaries across the KPIs that matter — impressions, clicks, CTR, conversions, CPA, ROAS, and spend — delivered as leadership-ready narratives and exportable outputs, not raw tables.

Account performance summaries

Roll up KPIs across all active campaigns for any period — yesterday, last 7 days, month-to-date, or a custom range — with period-over-period deltas and the top movers by spend, ROAS, and conversions, rendered as an executive narrative, a structured table, or a slide-ready summary.

TRY ASKING

- *"Give me a performance summary for the whole account for the last 7 days."*
- *"How did we do this week vs. last week? I need impressions, clicks, CTR, conversions and ROAS to paste into a deck."*
- *"Summarise all active campaigns for last month — best by conversions and ROAS, weakest by clicks — with three highlights and three things to improve, year over year."*

Single-campaign deep dives

Get a full KPI breakdown for one campaign, then drill into its ad groups or asset groups to see what is driving or dragging performance, along with efficiency signals such as rising CPA, falling CTR, or budget-capped delivery.

TRY ASKING

- *"Break down the 'Summer Sale' campaign for the first half of the month."*
- *"Give me a campaign-level report for 'Brand Search', then show which ad groups are dragging it down."*

- *"How has 'General Cord Reels' changed in the last 30 days versus the previous period, and what caused it?"*

Ad group & asset group reporting

Compare ad groups within a campaign on CTR, conversion rate, and CPA — and compare asset groups for Performance Max and Shopping — flagging low-CTR or zero-conversion groups for review.

TRY ASKING

- *"Compare the ad groups in my 'Brand Search' campaign by CTR and CPA for the last 30 days."*
- *"Which asset groups in my 'PMax – Shopping US' campaign are working this month, and which aren't?"*
- *"List ad groups with zero conversions but more than \$50 spend this month."*

Ad performance

Rank ads by CTR and conversions within an ad group, so you can see which ad is winning and which to pause.

TRY ASKING

- *"Rank the ads in the 'Shoes – Exact' ad group by conversions for the first half of the month."*
- *"Which of my responsive search ads are winning, and which should I pause?"*
- *"Show me the best and worst ads by CTR for last week."*

Keyword reporting

Surface top and bottom keywords by spend, conversions, CPA, or ROAS at any level — account, campaign, or ad group — with match-type mix and waste signals to guide pausing and bid changes.

TRY ASKING

- *"Top 20 keywords by spend in 'Brand Search' this month, with conversions and CPA."*
- *"Find keywords that are burning budget with no conversions over the last 30 days."*
- *"How are my exact vs. phrase match keywords performing this month?"*

Audience performance

Break down performance by audience association — remarketing, in-market, and custom — to see which segments convert best and where you are over- or under-invested, with the option to slice by demographic or location.

TRY ASKING

- *"Break down performance by audience for the account over the last 30 days."*
- *"Which audience segments are we over-investing in for the return this month?"*
- *"Which locations are driving the most conversions, and which are wasting spend?"*

Entity lookups & filtered lists

Pull a plain list of campaigns, ad groups, ads, keywords, or audiences filtered by an attribute — status, type, budget, or naming pattern — or by a metric threshold over a period. Straight data, not a narrative.

TRY ASKING

- *"Show me all active Pmax campaigns."*
- *"List every paused ad group in the account."*
- *"Which campaigns have a daily budget over \$500?"*

Leadership-ready & exportable outputs

Render the same KPI data as an Excel-ready table, a Power BI-ready flat dataset, a slide-ready bullet summary, or a one-paragraph executive narrative — with consistent KPI definitions and period framing across every format.

TRY ASKING

- *"Turn this month's account summary into a Power BI-ready table."*
- *"Give me three bullet points for leadership plus a clean Excel export of impressions, clicks, spend and ROAS."*
- *"Summarise Q2-to-date performance as slide-ready talking points."*

Anomaly & threshold alerts

Detect notable shifts — spend spikes, conversion drops, CTR collapses — over any window, and pinpoint which campaign or entity moved the most.

TRY ASKING

- *"Did anything unusual happen with account spend yesterday versus the day before?"*
- *"Flag any campaigns with conversions down more than 30% this week, and tell me what caused it."*
- *"What's the impression trend since January, and are there any anomalies?"*

Cross-Platform Comparison (Google & Microsoft)

Please note that for these use cases, in addition to integrating with Microsoft's MCP server, you will also need to do the same with Google for your Google ads account.

Compare campaigns, settings, and performance across Google and Microsoft — structure, configuration, and KPIs side by side — so you can spot differences, gaps, and opportunities between the two platforms. Please note that for these use cases, in addition to integrating with Microsoft's MCP server,

Account structure comparison

Compare what exists on each platform — campaign counts and types, ad groups, keywords, and audiences — and surface structural gaps where a campaign or entity is present on one platform but missing on the other.

TRY ASKING

- *"Compare my Google and Microsoft accounts — campaigns, ad groups, keywords and audiences on each side."*
- *"Which campaigns exist on Google but not on Microsoft?"*
- *"Give me a side-by-side structural summary of both accounts with counts."*

Campaign settings comparison

Compare configuration across platforms — bidding strategies, budgets, network, geo and language, and status — and flag settings that differ for the same campaign.

TRY ASKING

- *"Compare the bidding strategies and budgets for 'Brand Search' on Google vs. Microsoft."*
- *"Where do my campaign settings differ between Google and Microsoft?"*
- *"Show me network, geo and language settings side by side for both platforms."*

Performance comparison

Compare KPIs for the same campaign or entity across platforms, and identify where one platform outperforms the other over a given period.

TRY ASKING

- *"Compare conversions and ROAS for 'Brand Search' on Google vs. Microsoft this month."*
- *"Which platform is delivering cheaper conversions for the same campaign?"*
- *"Show CTR and CPA side by side for both platforms over the last 30 days."*

Keyword & match-type comparison

Compare keyword coverage and match types across platforms, surfacing keywords present on one platform but missing on the other.

TRY ASKING

- *"Compare my keywords and match types between Google and Microsoft for 'Brand Search'."*
- *"Which keywords am I bidding on in Google but not in Microsoft?"*
- *"Show match-type differences for the same keywords across both platforms."*

Asset group & Performance Max comparison

Compare Performance Max and Shopping asset groups and listings across platforms, surfacing asset groups or assets present on one platform but missing on the other.

TRY ASKING

- *"Compare my Performance Max asset groups on Google vs. Microsoft."*
- *"Which asset groups or assets exist on Google but not on Microsoft?"*
- *"Show me Performance Max structure side by side for both platforms."*

Audience comparison

Compare audiences and their associations across platforms, surfacing audiences applied on one platform but not the other.

TRY ASKING

- *"Compare my audiences and where they're applied on Google vs. Microsoft."*
- *"Which audiences exist on Google but not on Microsoft?"*
- *"Show audience associations side by side for the Retargeting campaign."*

Every example here is a starting point. Ask in your own words, at any level of detail, and refine the answer from there — the assistant works from the same live data across every scenario above.
